Glass Powders

GLASS POWDER

The glass powder is tiny glass beads in the micronized range that is created under certain conditions.

Depending on the type of application, the packaging conditions and the way it is separated, and even the materials used to enhance the quality, we have different grades of this powder.

Therefore, based on the required application, the price of powder will also change. In general, the glass powder is produced from clean glass waste free of debris and chemical dyes.

A worker wearing a blue protective suit and a helmet with a clear visor is using a sandblasting hose. The worker is holding the hose with both hands, and a stream of sand is visible coming out of the nozzle. The background is a blurred industrial setting.

APPLICATIONS OF GLASS POWDER

We have 1 to 2000 microns glass powder, and due to its suitable properties and resistance to acids and bases, it has many applications in various industries. This waste material is applied as a sandblast for equipment, decoration, oil industry, building facade, ceramic tile industry, and other purposes.

MAJOR APPLICATIONS

- An alternative to cement in the concrete industry (increasing the strength of concrete)
- Filler in concrete
- Ceramic tile industries (as glaze)
- Production of all types of glass beads
- In the medical equipment industry
- Production of adhesives and paints
- Filler in composites
- Sandblasting and water softening

STONE POLISHING

Under 200 microns glass powder can be applied for polishing stone surfaces. This material can be used to remove small scratches and it can make stone surfaces shining and bright. Our company is absolutely able to produce quality glass powder based on customer needs.
